From Tinkerer to Developer; Or How I Got My Dream Job

Today I got an interesting email from a GIS Analyst in Baltimore

Mr. Davis,

I am a GIS Specialist who is wrapping up an MS in GIS and looking forward to applying my newly acquired skills to projects here at Baltimore City's DOT. I recently stumbled onto your blog (<http://geospatialscott.blogspot.com/>) through an esri forum posting (<http://forums.arcgis.com/threads/32892-Google-Streetview-and-Javascript-api>) and was quite impressed with the breadth of your programming skills and abilities.

I was asked if I could try to create a program that would display accident history reports based on intersections in a GIS. My GIS application development experience is limited to what I learned through my coursework and I do not have a programming background. My question for you is how did you go about developing your programming skills as a GIS professional? Do you know of any resources that might aid me in going from a GIS analyst to a creative GIS developer like yourself? I see a heavy need for this type of GIS Developer work here at Baltimore DOT and I would like to contribute as much as possible, utilizing all the skills and resources available to me.

I'm sure you are super busy, but any suggestions or input would be much appreciated from this aspiring GIS(lowercase)p.

Am I doing this right?

Scott Davis

BOILERPLATE

MECHANICAL MARVEL OF THE NINETEENTH CENTURY

Boilerplate with Archibald Campion
Click to enlarge photo

Boilerplate was a mechanical man developed by Professor Archibald Campion during the 1880s and unveiled at the 1893 World's Columbian Exposition.

Built in a small Chicago laboratory, Boilerplate was a prototype soldier built for "*preventing the deaths of men in the conflicts of nations*". Although it was the only such prototype, Boilerplate was eventually able to exercise its proposed function in several combat actions.

Boilerplate embarked on a series of expeditions to demonstrate its abilities, the most ambitious being a voyage to Antarctica. Boilerplate is one of history's great ironies, a technological milestone that remains largely unknown.

Creating Builds

Dojo's build system provides a way to "build" Dojo and your other JavaScript resources and CSS files, so they can be more efficiently used in a production environment by your applications.

Difficulty: Advanced **Dojo Version:** 1.8

ABOUT THE AUTHOR

Kitson Kelly is a Senior IT Manager by day and a Dojo committer by night.

An American living in the UK, he has been culturally confused for years.

TUTORIAL CREATED BY

"Building" Dojo or JavaScript?

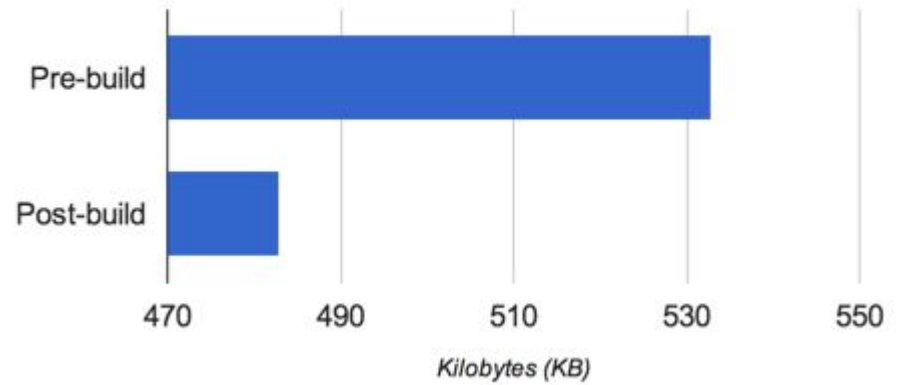

If you are used to other programming languages, you might be wondering why we would be discussing "building" Dojo or JavaScript, because building usually implies compiling code into machine byte code. But when we talk about building Dojo we are referring to the concepts of minification, optimization, concatenation and "dead-code" removal.

GRUNT

The JavaScript Task Runner

Latest Version

- Stable: v0.4.1
- Development: N/A

Latest News

[Grunt 0.4.1 released](#)

March 13, 2013

[Grunt 0.4.0 released](#)

February 18, 2013

[Updating plugins to Grunt 0.4](#)

February 15, 2013

Getting Started

Read the [Getting Started](#) guide for

Why use a task runner?

In one word: automation. The less work you have to do when performing repetitive tasks like minification, compilation, unit testing, linting, etc, the easier your job becomes. After you've configured it, a task runner can do most of that mundane work for you—and your team—with basically zero effort.

Available Grunt plugins

Many of the tasks you need are already available as Grunt Plugins, and new plugins are published every day. While the [plugin listing](#) is more complete, here's a few you may have heard of.

Why use Grunt?

The Grunt ecosystem is huge and it's growing every day. With literally hundreds of plugins to choose from, you can use Grunt to automate just about anything with a minimum of effort. If someone hasn't already built what you need, authoring and publishing your own Grunt plugin to npm is a breeze.

package.json

```
{  
  "name": "AppName",  
  "version": "0.1.0",  
  "devDependencies": {  
    "grunt": "~0.4.0",  
    "grunt-contrib-jshint": "~0.1.1",  
    "grunt-contrib-jasmine": "~0.3.3",  
    "grunt-contrib-watch": "~0.2.0",  
    "grunt-contrib-connect": "~0.1.2"  
  }  
}
```

Project Scaffolding

grunt-init

Grunt-init is a scaffolding tool used to automate project creation. It will build an entire directory structure based on the current environment and the answers to a few questions. The exact files and contents created depend on the template chosen along with the answers to the questions asked.

Note: This standalone utility used to be built-in to Grunt as the "init" task. See the Grunt [Upgrading from 0.3 to 0.4](#) guide for more information about this change.

Installation

In order to use grunt-init, you'll want to install it globally.

```
npm install -g grunt-init
```

This will put the `grunt-init` command in your system path, allowing it to be run from anywhere.

Notes: You may need to use `sudo` or run your command shell as Administrator to do this.

The Future

- UI Tests with Selenium
- MVC
- Automated system/application checks
- Continuous Integration
- More Grunt-init/Yeoman

Questions/Thanks!
